Family engagement in research and development – The case of children with Cerebral Palsy

#fighthestroke

Agenda

- FightTheStroke Foundation
- Family engagement in research and digital therapeutics
- Mirrorable
- AINCP
- MirrorHR
- Take home messages

#fightthestroke

FightTheStroke Foundation

Since 2014 we've built a movement of more than 1000 families in Italy and established worldwide alliances, starting from our lived experience with a child with a disability of Cerebral Palsy

Being represented: from the first child with CP on a TED stage to 17M of people in the world like Mario

TED Ideas worth spreading

FightTheStroke story of participation in Responsible Research and Innovation

The reason why behind Mirrorable 1st Tele-rehab Platform based on AOT

The stroke
23/01/2011

A huge problem.

A weak solution.

Rehab proposals at that time:

1. No evidence based
2. No saliency for the patient
3. No goal directed
4. No targeting the whole family
5. Late discovery → late intervention
6. Extensive treatments
7. No peer learning
8. No availability out of the hospital
9. No data gathering = no relevance for science and industry
10. Not specific, neither effective

Many system pains.

From a prototype to an effective solution for the whole ecosystem

Sept 2016	Oct-Dic 2016	Jan-April 2017	May 2017-2018

AOT Action observation treatment
FMA Fugl-Meyer Assessment
FMA-UE Fugl-Meyer Assessment for upper extremity

AIM To evaluate the feasibility and effectiveness of an action observation treatment (AOT) home-based platform promoting child-to-child interaction to improve hand motor function in unilateral cerebral palsy (CP).

METHOD Twenty children (14 males, six females; mean age 6y 7mo, standard deviation 1y 7mo; range 5y 1mo–10y 6mo) with unilateral CP underwent 20 sessions where they had to observe and then imitate a wizard performing dexterity-demanding magic tricks; a child-to-child live video-session to practise the same exercise then took place. We assessed hand-motor skills with the Beata Scale, neurological motor impairment with Fugl-Meyer Assessment for upper extremity, as well as spasticity, muscle strength, visual analogue scale, and global impression.

clinical validation of **A**rtificial **I**ntelligence for providing a personalized motor clinical profile assessment and rehabilitation of upper limb in children with unilateral **C**erebral **P**alsy

Call: HORIZON-HLTH-2021-DISEASE-04

Type of Action: RIA

Acronym: AINCP

Grant Agreement: 101057309

Project starting date: 01 June 2022

Project end date: 31 May 2027

Project duration: 60 months

12 partners
from 7 countries

Our goal is to design an economical, ethical, sustainable decision-making process for delivering a personalised and validated approach, focused on the care, monitoring and rehabilitation of Upper Limb in children with Unilateral Cerebral Palsy

Our approach

AINCP uses a multidisciplinary approach, where all project collaborators (clinicians, data scientists, physicists, engineers, economists, ethicists, small medium-sized enterprises, children and parent associations) work closely together in building the solution.

www.aincp.eu

FTS

Funded by
the European Union

Unilateral Cerebral Palsy

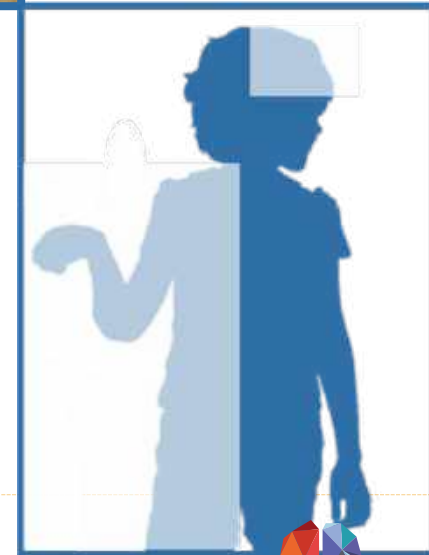

- the most frequent motor type:
30-40% of children with CP
- up to one child in 1,000 live births

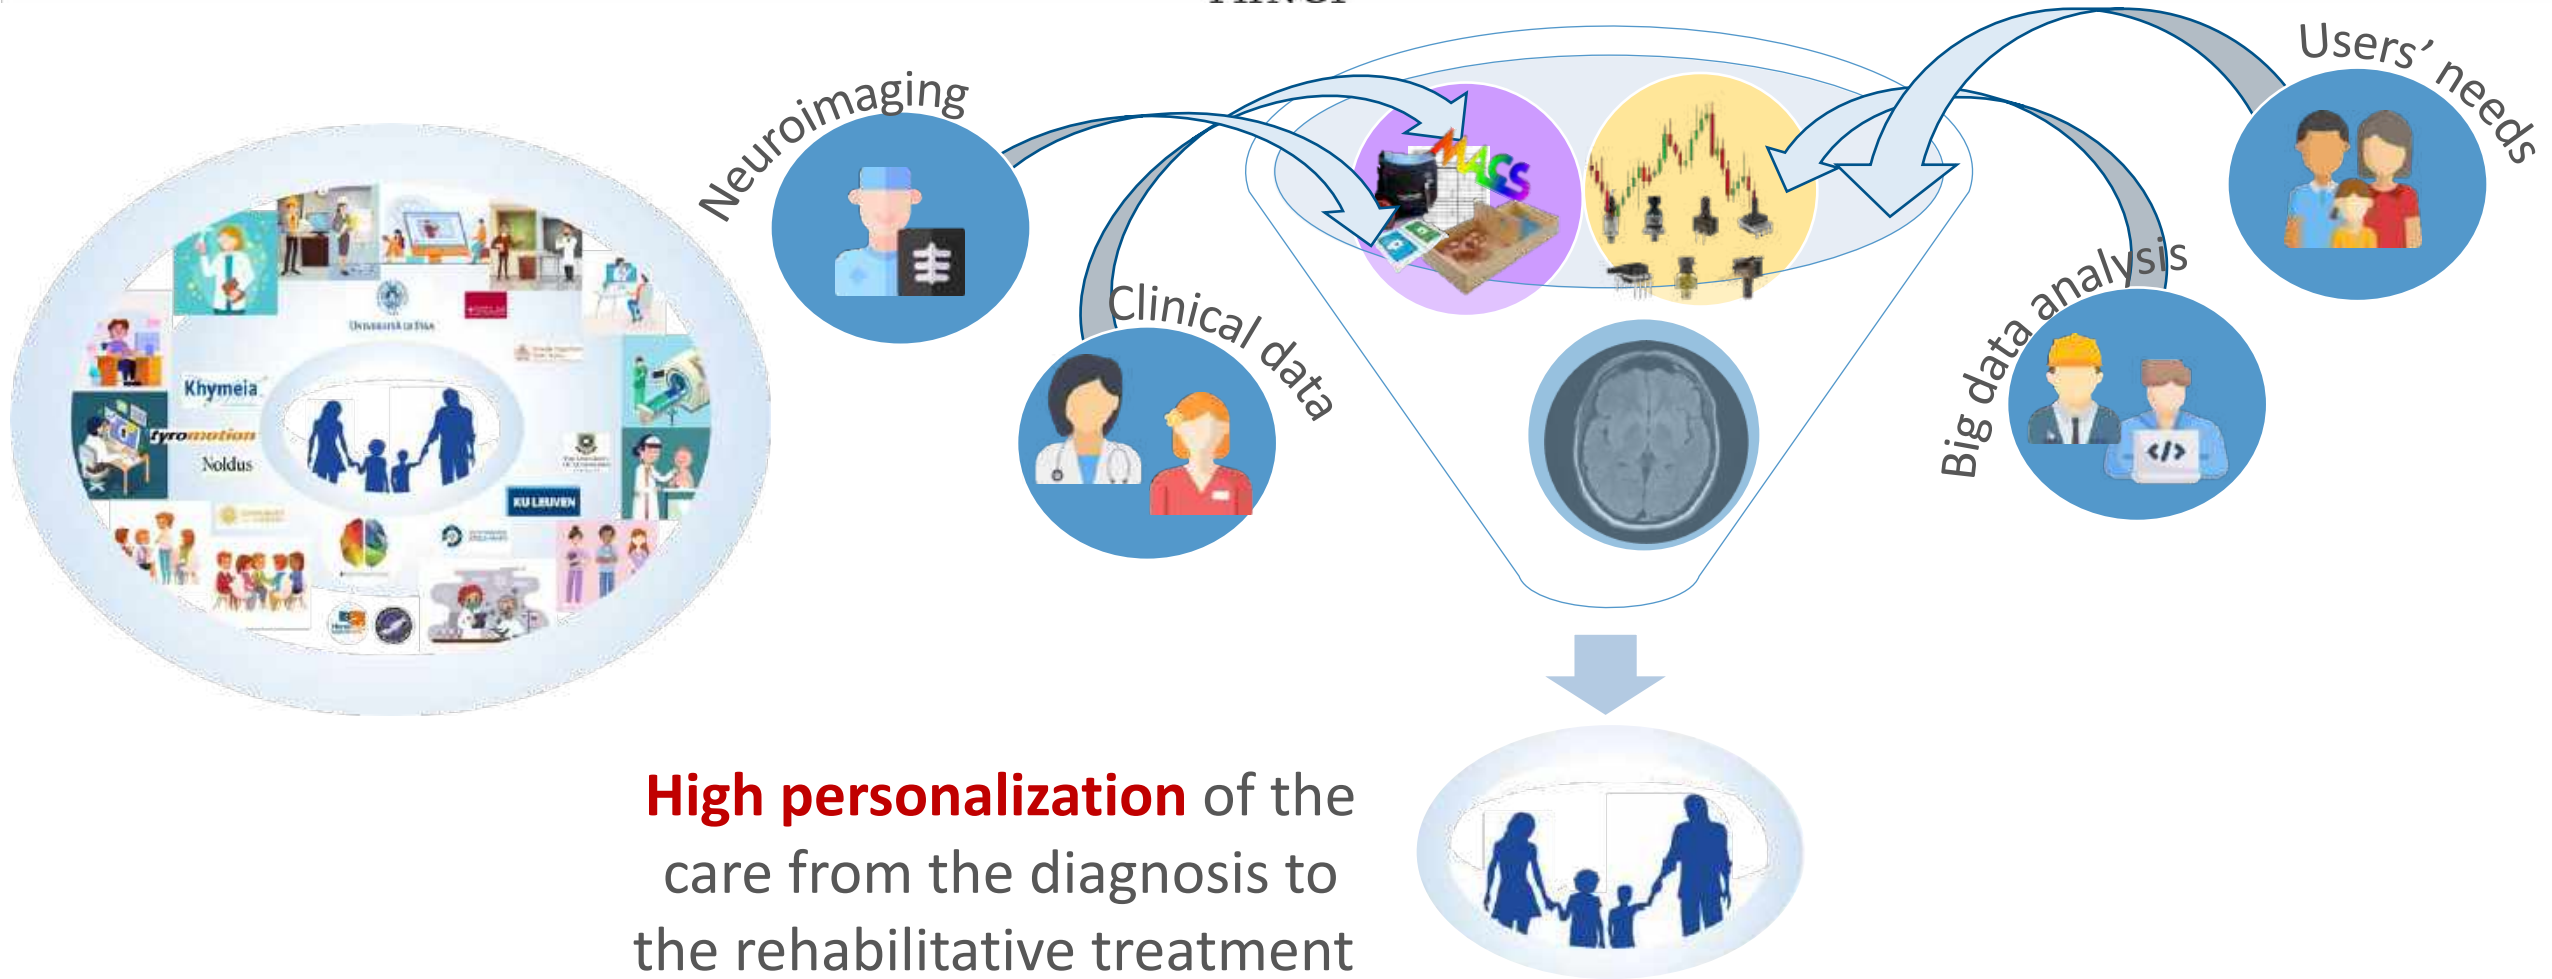

In Europe:

- every year 5,050 new cases
- about 55,000 subjects in developmental age (0-18 years) live

Main target of rehabilitation:

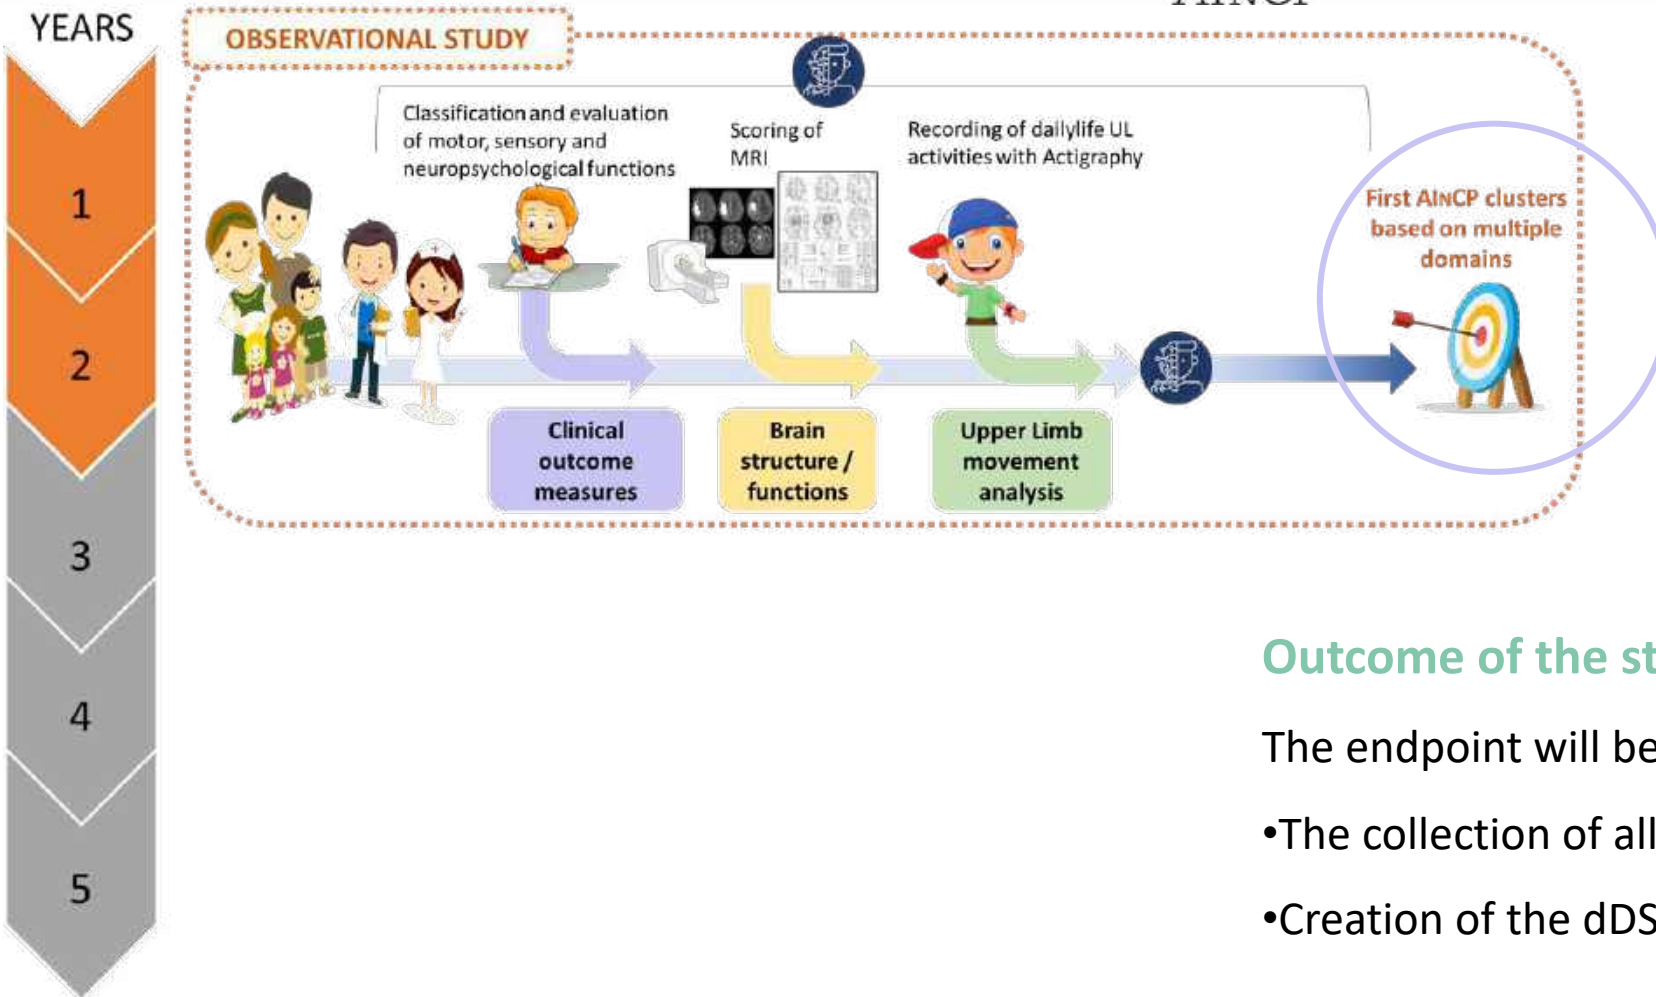

- Upper limb

High personalization of the care from the diagnosis to the rehabilitative treatment

AIInCP observational study

Outcome of the study

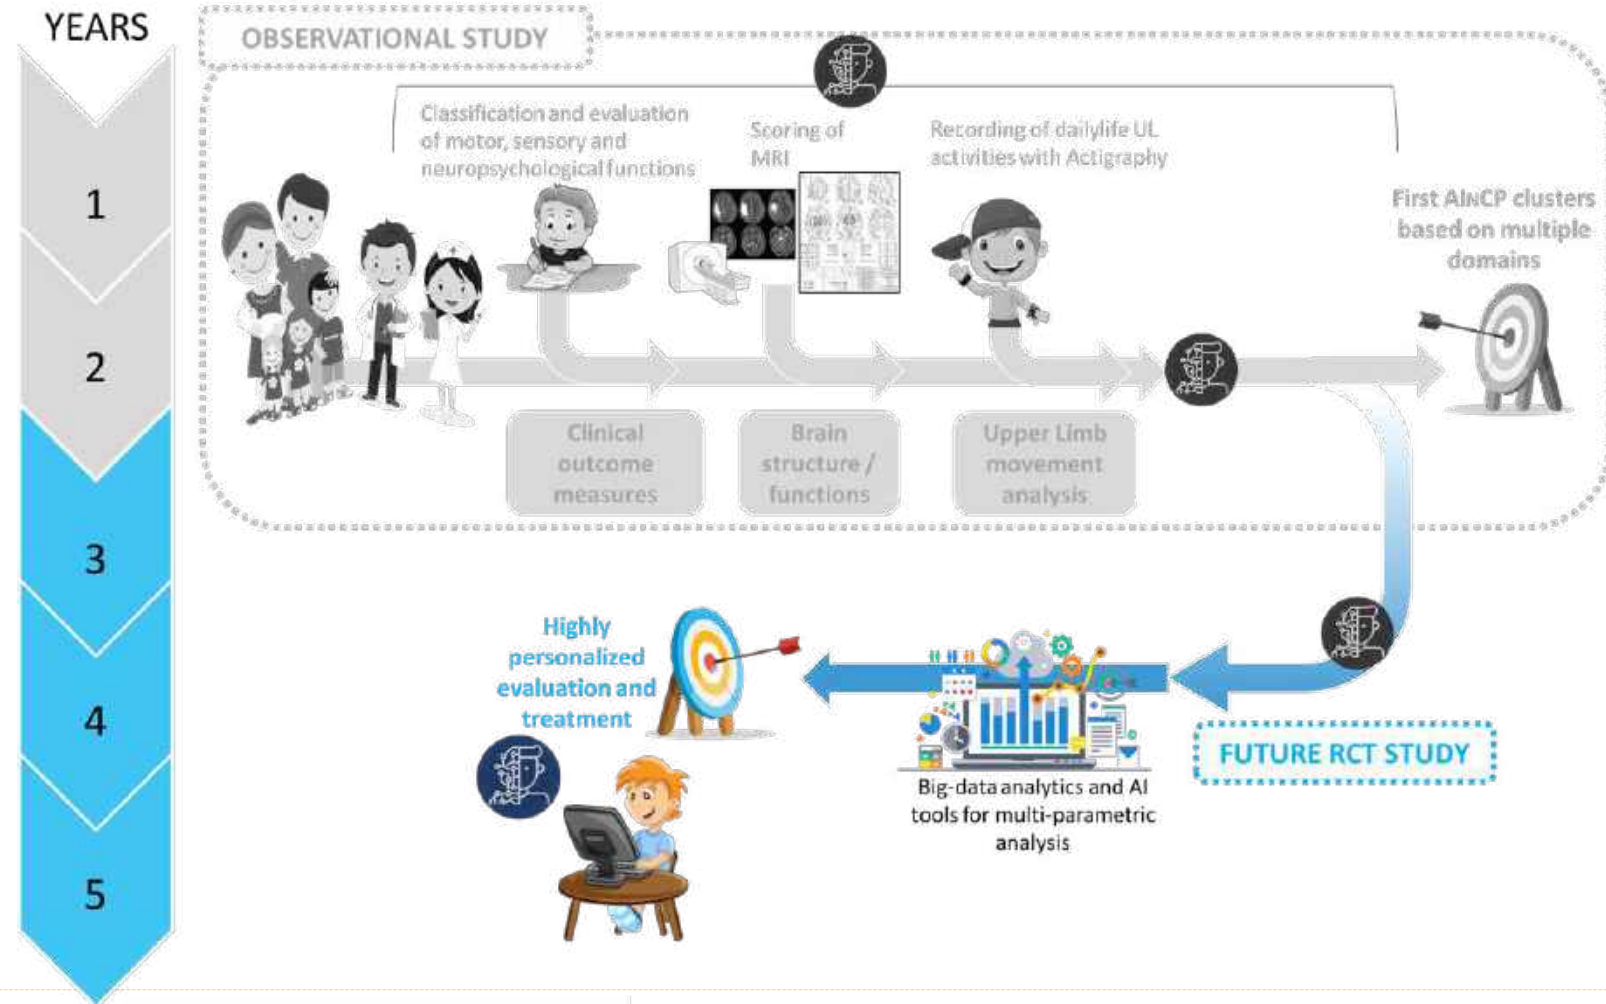

The endpoint will be:

- The collection of all planned measurements
- Creation of the dDST, by means of AI and Big data analyses

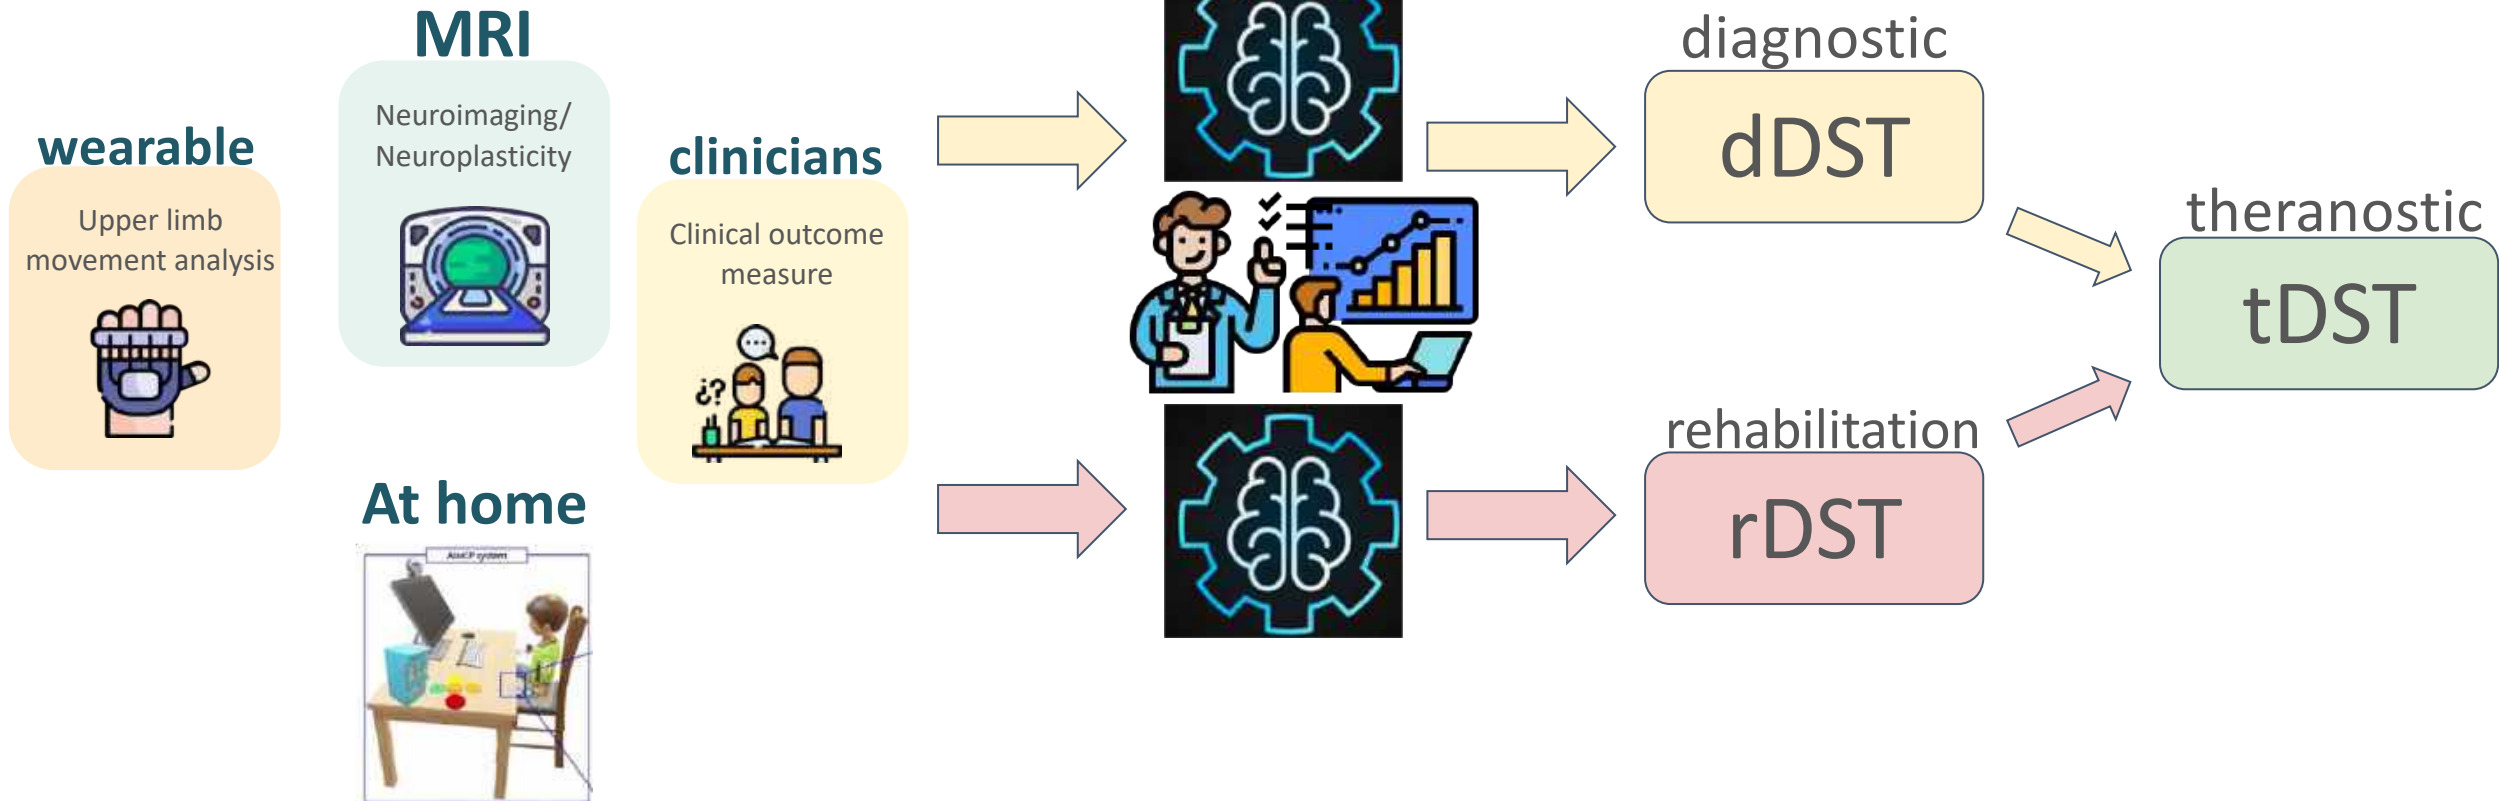

AIInCP experimental study

→ Creation of highly personalized rehabilitative models

#fightthestroke

MIRRORHR

MirrorHR: the first epilepsy research kit built together with Microsoft, giving back data ownership to the patients

Goal #1: Give Users a Peace of Mind at Night

- 70% of seizures are indicated by a spike in heartbeat
- Set the minimum and maximum bpm thresholds
- The application will monitor the user's heartrate throughout the session

No Crisis: Click this button for false alarms

Help: Contacts local emergency responders

End of Crisis: Press this button when seizure is over to end the session

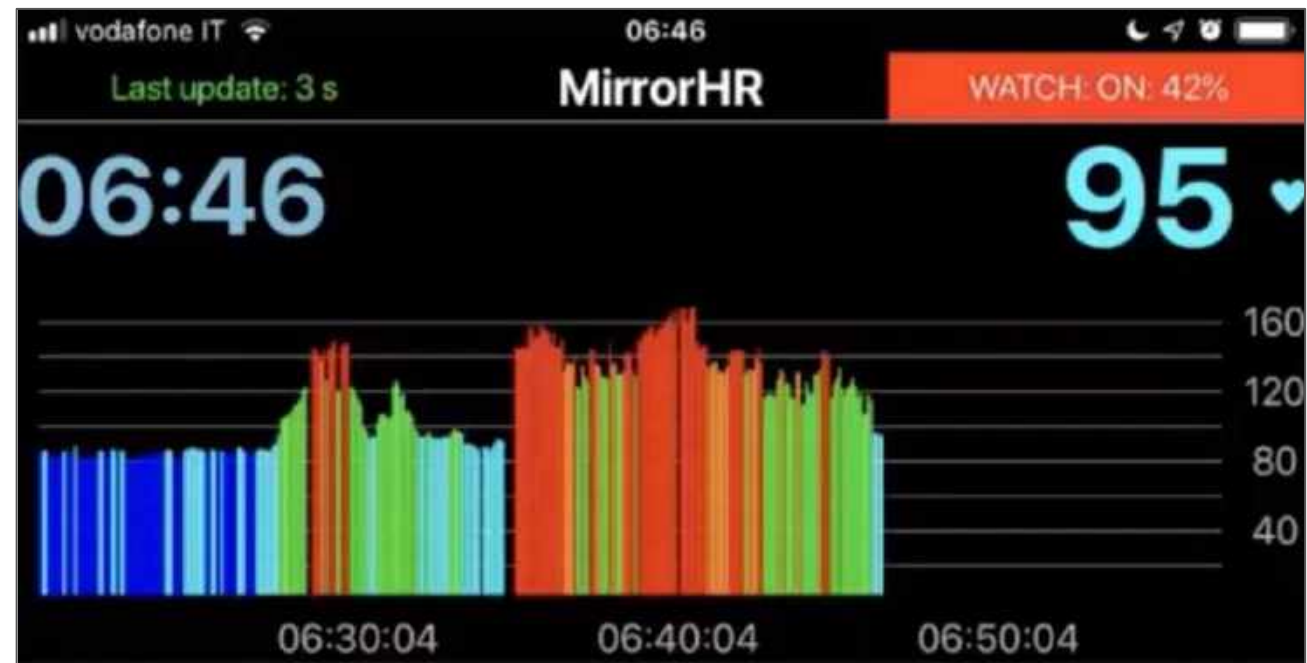

Video: This option allows caregivers to record the seizure to share with doctors

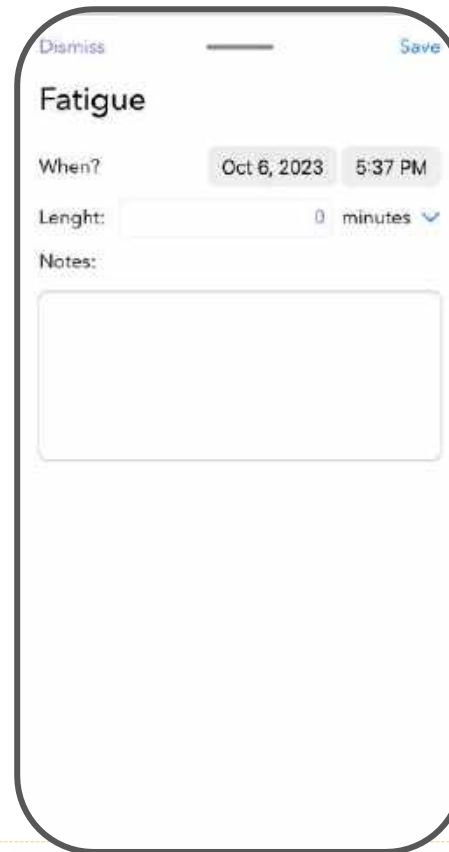

Seizure with no early intervention: x-axis in in **hours**

Seizure with early intervention: x-axis in in **minutes**

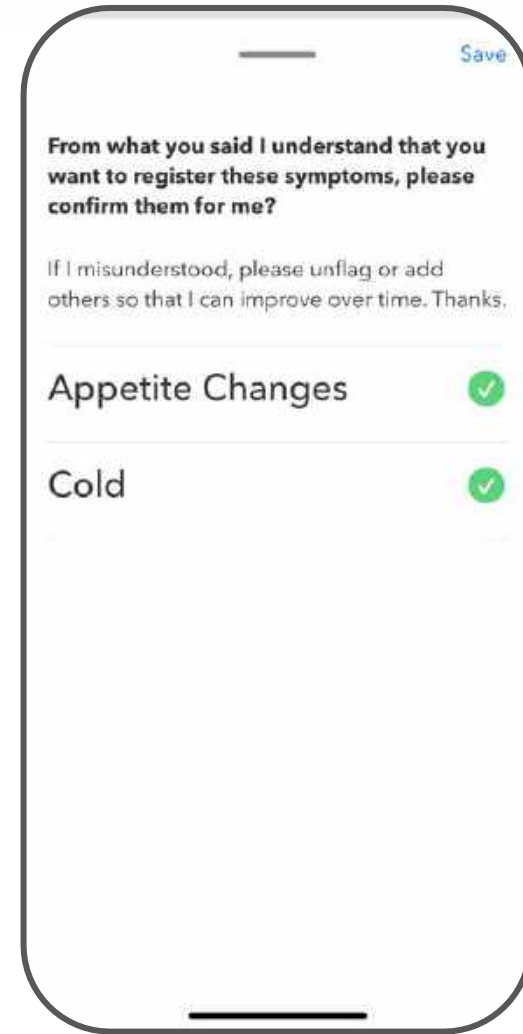

Goal #2: Provide an Online Symptom Tracker

“Today I had a bit of a cold and some appetite changes.”

Goal #3: Foster Research Initiatives

Use Machine Learning to Predict Seizure Trigger

Our goal is not to predict seizures, rather to reduce the **frequency** and **severity** of them.

Figure 1 reveals the correlations between symptoms and seizures on a sample subset of data.

Figure 1

Where We Are:

- 4,000+ downloads from the app store
- Available in 21 languages
- Users in 61 countries
- 4,000 seizures logged
- 70,000 symptoms logged
- 25,000,000+ bpm measurements

- Majority of users located in Europe, Middle East, and Asia
- Minimal presence in America due to high cost of advertising

Why co-creating, since the beginning?

- Time saving
- Cost saving
- Rewarding
- Higher scores of Patient Activation Measure imply higher compliance
- More shared knowledge imply less misunderstanding
- Care effective

Allyship in research: how to make it happen

RESEARCHERS

- Do not display disability as a punishment
- Clean up your ableist language
- Do not presume, get rid of bias, do not steal hope
- Start finding solutions together from the beginning
- Show me the data
- Recognize mutual competences, don't be afraid to say 'We don't know'
- Active and continuous listening to changing habits

CAREGIVERS

- Improve health literacy level
- Avoid conspiracy theories and fake news sources
- Rely on communities for peer experiences sharing
- Get rid of not evidence-based treatments
- Share reliable sources of data with your doctors
- Recognize mutual competences, don't ask a neurologist for and advice on children books
- Do your homework

Some references

Table. Recommendations for Creating Disability Conscious Medical Education

Theme	Recommendations
Recognize diversity of disability	<ul style="list-style-type: none"> • Include a variety of disability types. • Consider the balance between education focusing on a specific subset of disability (eg, physical disability) and education focusing on a broader representation of different disability lived experiences. • Include intersectional identities in the curriculum.
Move beyond medical model	<ul style="list-style-type: none"> • Define ableism and its manifestations at the individual, institutional, and societal levels. • Include the social model of disability in teaching. • Utilize disability studies and disability justice principles.
Develop respectful curiosity	<ul style="list-style-type: none"> • Acquire the skills to ask questions that advance trainee knowledge of how to provide patient-centered care.
Prioritize continual engagement and learning	<ul style="list-style-type: none"> • Integrate a longitudinal curriculum across preclinical and clinical years. • Utilize a variety of teaching formats (eg, standardized patients with disabilities, patient panels, home and community visits). • Leverage existing knowledge and resources.
Center disabled people	<ul style="list-style-type: none"> • Engage with people with disabilities. • Hire disabled people as teachers. • Include disabled faculty on high-level curricular committees. • Continually seek feedback from disabled people.

**Restablishing asymmetries allows building trust and frictionless relationships:
that's how we're working together as families and people with disabilities engaged in research
and development of child health tech!**
