Understanding the Medical Device Regulation

- The EU Medical Device Regulation 2017/745 (MDR) applies to all medical devices placed on the EU market, without specific provisions dedicated to paediatric or orphan devices.
- Although the MDR allows for the principle of proportionality to be applied, compliance requirements are still determined through a risk-based classification system.
- Regardless of manufacturer size or annual device sales volume, all manufacturers must meet the applicable legislative requirements based on the device's assigned risk class.

CHAPTER VI
CLINICAL EVALUATION AND CLINICAL INVESTIGATIONS

Article 61

Clinical evaluation

1. Confirmation of conformity with relevant general safety and performance requirements set out in Annex I under the normal conditions of the intended use of the device, and the evaluation of the undesirable side-effects and of the : 1, shall be based on clinical data rred to in Annex III.

providing sufficient clinical evidence,

The manufacturer shall specify and justify the level of clinical evidence

To that end, manufacturers shall plan, conduct and document a clinical evaluation in accordance with this Article and Part A of Annex XIV.

Tell the story...

Proving Sufficient Clinical Evidence

- Low Risk
- Indirect Clinical Benefit
- Known Market History
- Known Behaviours
- Unethical/Inappropriate to collect evidence
- Technical Standards
- Established Generic Device Group

- High Risk
- Direct Clinical Benefit
- Novel Technology
- Residual Risks
- Potential Opportunities to Collect Pre-Market Evidence
- Absence of Technical Standards
- Longer Lifetime

Orphan Medical Devices and Pediatric Cardiology – What Interventionists in Europe Need to Know, and What Needs to be Done

Abstract
Medical devices include a great diversity of technologies, which are evaluated and approved in the European Union (EU) according to a technical law that came into effect on 26 May 2021, known as the Medical Device Regulation or MDR (EU/2017/745). It has a transitional period that allows products that were approved under the previous rules (the EU Medical Device Directive) to continue to be marketed until 26 May 2024 at the latest. As a result of a series of adherence factors, there is a possibility that the MDR may result in products becoming unavailable, with the consequent risk of a loss of some interventional devices that are relevant to these devices. Devices that are used for orphan or pediatric indications are particularly vulnerable to this. There is an urgent need for policy to be developed to protect essential medical devices for orphan indications and for use in children, to ensure that essential interventions can continue, and to ensure a more sustainable system in Europe over the longer term. Pediatric interventionalists in Europe need to be aware that particular line items (products) may have been unavailable over the next few years, and they should contribute to plans to mitigate this risk, so that they can continue to deliver the best possible care for their patients. This commentary examines the factors which have contributed to this issue and suggests ways that policy can be developed to address it.

Keywords Medical Device · Regulation · Intervention · Orphan product

Introduction
Medical devices range from simple wound dressings to complex products such as pacemakers. Their approval is determined by their risk classification and by the system that applies in each jurisdiction. In Europe, the regulations concerning medical devices have recently been subject to significant changes.
Medical devices used in children and those used for the treatment of rare diseases (therapeutic orphan devices) have very different market dynamics, characterized by low sales and a reduced return on investment, when compared to general medical devices. These products are therefore particularly vulnerable to being withdrawn from sale if additional barriers arise, for example from increased regulatory requirements and costs or from longer approval times. Already, many interventions in pediatric cardiology are heavily reliant on the ‘off-label’ use of medical devices intended for adults, often in different anatomical locations or organ systems [1].
In this paper, we review the regulatory changes that have occurred in the European Union (EU) and discuss their potential impact on the availability of essential or pediatric devices. We examine the types of support that are provided in other regulatory systems, and we recommend how policy-makers and clinicians can ensure that risks to patients are mitigated as much as possible.

Medical Device Coordination Group Document

MDCG 2024-10

MDCG 2024-10

Clinical evaluation of orphan medical devices

June 2024

This document has been endorsed by the Medical Device Coordination Group (MDCG) established by Article 103 of Regulation (EU) 2017/745. The MDCG is composed of representatives of all Member States and it is chaired by a representative of the European Commission.

The document is not a European Commission document and it cannot be regarded as reflecting the official position of the European Commission. Any views expressed in this document are not legally binding and only the Court of Justice of the European Union can give binding interpretations of Union law.

Orphan device status enables *proportionate* regulatory pathways not reduced safety expectations.

- Orphan devices address rare diseases / small patient populations ($\leq 12,000$ patients/year in EU) and often significant unmet medical need
- MDR does not relax Annex I General Safety & Performance Requirements (GSPRs) for orphan devices → All applicable GSPRs must still be met
- **MDCG 2024-10 recognises that:**
 - Pre-market clinical evidence may be limited, but
 - This must be explicitly justified, transparent, and post-market clinical follow up (PMCF) activities are critical

Notified Bodies must balance:

- Proportionality & feasibility
- Scientific uncertainty
- Patient safety and public trust

The Role of the Notified Body in Orphan Device Conformity Assessment

NBs remain fully accountable for conformity decisions under the MDR.

What the NB must do

- Verify orphan device status early (structured dialogue or application review)
- Assess technical documentation using the same conformity principles as non-orphan devices

Critically evaluate:

- ✓ Whether Annex I GSPRs are met
- ✓ Whether limitations in pre-market clinical data are acceptable and justified
- ✓ Whether the benefit-risk profile is favourable

What the NB cannot do

- Accept orphan status as a reason for lower clinical scrutiny
- Accept vague or aspirational PMCF plans
- Ignore unresolved safety or performance uncertainties

Key Regulatory Tool

Certificates with conditions / provisions (Annex VII, Article 56)→ Common and appropriate for orphan device

We recognise the challenges – but scientific justification must lead the strategy

Acknowledged realities

- Small patient populations
- Ethical and practical limits on clinical investigations
- Disproportionate cost vs. sales volume
- Vulnerable populations (paediatrics, emergencies)

What proportionality looks like in practice

- Robust use of pre-clinical data to support GSPRs
- Clearly articulated expected clinical benefit
- Transparent identification of clinical evidence gaps
- Justification that:
 - Further pre-market data is not feasible or proportionate
 - Residual uncertainty is controlled and monitored

For orphan devices, PMCF is the backbone of the lifecycle evidence strategy

Why PMCF matters more

- Accepted pre-market limitations must be resolved post-market
- Lifecycle benefit-risk determination depends on PMCF data

What Notified Bodies expect

- A detailed, structured, credible PMCF plan
- Clear linkage between:
 - Identified pre-market evidence gaps
 - Specific PMCF activities designed to address them
- Realistic timelines aligned with actual usage volumes

•Use of:

- Registries
- Prospective PMCF investigations
- Real-world clinical data

Honest acknowledgement

- Small numbers and slow data accrual are expected
- But “difficult” is not a justification for “undefined”

Regulatory reality

Failure to deliver on PMCF commitments→ Risk to certificate validity

Structured Dialogue, Expert Panels, and Working Together

Early engagement prevents late failure.

Structured Dialogue

- Best opportunity to:
 - Align on orphan status justification
 - Discuss clinical evidence limitations
 - Set realistic PMCF expectations
- Does not replace conformity assessment
- Must respect NB independence and impartiality

Expert Panel Advice

Expert panel opinions are scientifically critical

They provide:

- Validation of orphan status
- Advice on clinical data sufficiency and uncertainty

Important distinction:

Scientific advice ≠ automatic regulatory compliance

Notified Bodies must:

- Consider expert panel advice carefully
- Explain and justify any divergence from the panel opinion
- Maintain accountability for MDR conformity decisions

To Conclude...

- **A pragmatic, collaborative approach is needed** to address orphan and paediatric device challenges while ensuring continued patient access and maintaining regulatory compliance.
- **Notified Bodies must operate within the legal framework**, but should be proactive, adaptable, and open to working with manufacturers to identify appropriate risk-based solutions.
- **Risk mitigation strategies should be considered**, including enhanced post-market surveillance and greater reliance on robust pre-market data where clinical evidence is inherently limited.
- **Manufacturers have a responsibility to engage early and proactively with Notified Bodies** to support ongoing device availability for orphan and paediatric indications.
- **High-quality justification is essential**: manufacturers must provide clear, well-documented rationales for limited or absent clinical evidence, creating the foundation for Notified Bodies to assess risks and agree appropriate regulatory pathways.
